Fixed Point Iteration
Written by Zachary Ferguson

Q1a:
    g(x) = (2x+2)^(1/3) = x
    n = 11
    xc = 1.7692923634

Q1b:
    g(x) = ln(7-x) = x
    n = 11
    xc = 1.6728216952

Q1c:
    g(x) = ln(4-sin(x)) = x
    n = 8
    xc = 1.1299805001

Q3a:
    g(x) = (x + 3 / x) / 2
    x0 = 2
    n = 4
    xc = 1.7320508076

Q3b:
    g(x) = (x + 5 / x) / 2
    x0 = 2
    n = 4
    xc = 2.2360679775

Q5:
    g(x) = cos^2(x)
    n = 325
    xc = 0.6417141321

    d/dx g(x) = -2*cos(x)*sin(x)
    |d/dx g(xc)| = 0.9589931641
    Therefore g(x) is locally convergent to xc.
